

School Management System — Proposal

Al Fitrah Pre School, Sarjapura — Sompura Gate, Sarjapura, Bengaluru

Prepared for	Al Fitrah Pre School, Sarjapura
Prepared by	DVLN Solutions LLP
Date	21 August 2026
Basis	Fixed price for the whole platform, stated against effort
Total	₹45,000 for approximately 146 hours of work
Validity	30 days from issue

1. What is being built

One system, six parts:

1. A public website for the school.
2. A CRM holding every student and every teacher.
3. Attendance marking, daily — students by their class teacher, staff by themselves with a location stamp.
4. Fee setup, collection through SBI Collect, and receipts.
5. A permanent registration ID per student, with the full record attached to it.
6. A parent portal, where a guardian sees their own child's attendance, documents and fees.

Sized for the current roll of **30 students**. The design does not change at 300; only the hosting plan would.

A substantial part of this is already built and running. Section 2 separates what is delivered from what remains, so the school can see both what it already has and what it is still waiting for.

2. Hours and price

The quote is for the platform as a whole — everything below, built and remaining, for one price. Less than half the effort remains; the larger share is already built and running.

2.1 Already delivered and running

#	Workstream	Hours
1	Website — 13 public pages, admissions enquiry, SEO	16

#	Workstream	Hours
2	Admissions CRM — leads, pipeline, follow-up reminders, capture forms	18
3	Student register — records, registration ID, history, CSV import	12
4	Student attendance — daily registers, reports, exports	8
5	Fees — structures, invoices, receipts, append-only ledger	12
6	Parent portal foundation — sign-in, children, balance, payment history	6
7	News CMS, insights, audit log, settings, staff roles	8
	Delivered	80

2.2 Remaining

#	Workstream	Hours
8	Teacher / staff CRM — records, roles, access	10
9	Staff attendance — self check-in and check-out with a location stamp	10
10	Parent portal completion — attendance, documents, fee payment	14
11	Fee payment — SBI Collect import, plus Razorpay for instant confirmation	16
12	Move to AWS and Cloudflare, cutover	10
13	Data import, training, handover	6
	Remaining	66

2.3 The number

Total effort	146 hours
Total fee	₹45,000
Works out to	~₹308 per hour

Fixed price: if a workstream runs over its estimate, the school pays the quoted fee, not the extra hours.
Exclusive of GST where applicable.

Payment: ₹18,000 on signing (covering what is already delivered), ₹14,000 when workstreams 8–10 are accepted, ₹13,000 on handover. Invoices from DVLN Solutions LLP, payable in 15 days.

3. What each workstream delivers

Workstreams 1–7 are built and running. 8–13 remain.

1 — Website (16 h) · delivered

Home, About, Programmes, Admissions, Campus Life, Careers, Contact, FAQ, News, Syllabus, Parent Resources, Privacy. Mobile first. An admissions enquiry form that writes straight into the CRM — no email forwarding, no re-typing. Search-engine basics: sitemap, page titles, structured data for a local school.

2 — Admissions CRM (18 h) · delivered

Every enquiry becomes a lead with a stage, an owner and a note history. Duplicate detection so the same parent phoning twice does not become two records. Daily follow-up reminders by email so nobody is forgotten. Enquiry, application and referral capture forms all feed the same inbox. Export to CSV.

3 — Student register (12 h) · delivered

One record per student: name, date of birth, class and section, guardians with phone numbers, address, admission date, status. Search by name, registration ID, class or guardian phone. Bulk import from the existing register via CSV.

4 — Student attendance (8 h) · delivered

Class register on screen: mark the whole class in one pass. Stamped with who marked it and when. Monthly attendance per student and per class, absence list for the day, export to CSV for any date range.

5 — Fees (12 h) · delivered

Fee structures per class (tuition, admission, transport, other heads), term or monthly. Invoices against a student, payments against an invoice. Receipt with a serial number, printable and downloadable. An **append-only ledger**: a wrong entry is reversed with a visible correcting entry, never edited away. Outstanding-dues list, sorted by amount and days overdue.

6 — Parent portal foundation (6 h) · delivered

Guardian sign-in, the list of their own children, each child's balance and payment history. A parent can only ever reach their own children — enforced at the data layer, not just on the page.

7 — News CMS, insights, audit log, settings (8 h) · delivered

School news and events published from the admin console. A dashboard of enquiry and admission numbers. An audit log recording who changed what. Settings for fee heads, class sections, attendance statuses and staff roles, so the school can adjust these itself without a developer.

8 — Teacher / staff CRM (10 h)

One record per staff member: name, role, contact, joining date, class assignment, documents. Login accounts with three levels — Principal (everything), Office (students, fees, attendance), Teacher (own class attendance only). A teacher cannot see fee data.

9 — Staff attendance with location (10 h)

Teachers mark their own check-in and check-out from their phone. Each mark records the time from the server and the location from the phone, and the system works out how far that is from the campus.

Two things worth being clear about, because they shape how the school should read the register:

- **The location is a note, not a proof.** A phone's reported position can be overridden, so this records where a check-in came from — it does not verify that a teacher was physically present. For a staff room of under a dozen people, that is the right level.
- **A poor signal is not treated as absence.** Indoors, a phone is routinely accurate only to 50–100 metres, which is exactly where a teacher stands while marking. The system widens its allowance by whatever accuracy the phone reports, and a check-in outside the campus boundary is **flagged for the Principal, not blocked**. Blocking would lock out a teacher standing inside the school with a weak signal.

Location is captured only at the moment of marking. There is no background or continuous tracking, and none is possible with this design.

10 — Parent portal completion (14 h)

On top of workstream 6: the child's attendance record, documents to view and download, what fees are due, and a way to pay them. Downloads go through an authenticated route, so a document link cannot be forwarded to somebody who is not a guardian.

11 — Fee payment (16 h)

Both rails, described in Section 5: the SBI Collect reconciliation import, and Razorpay for parents who want the payment confirmed instantly.

12 — Move to AWS and Cloudflare (10 h)

Set up in accounts owned by the school, with daily automated backups, and cut over from the current hosting with a tested rollback. See Section 6.

13 — Data import, training, handover (6 h)

Existing student data imported and reconciled. Two training sessions — one for office staff, one for teachers. A written operations manual. Source code handed over.

4. Registration ID and student history

Every student gets one ID at admission:

AF-SJP-26-014

serial within the year
admission year (2026)
branch (Sarjapura)
Al Fitrah

Rules:

- Allocated once, at admission. Never changes — not on class promotion, not on re-admission after a gap.
- Never reused, even after a student leaves.
- Printed on every receipt, report and letter.
- The parent's handle for the portal.

Everything hangs off this ID and stays for as long as the school keeps the record:

Attached to the ID	Retained
Admission form and enrolment details	Permanently
Class and section history, year by year	Permanently
Daily attendance	Permanently
Every invoice, payment and receipt	Permanently
Uploaded documents (birth certificate, photo, ID proof)	Permanently
Change log — who edited what, when	Permanently

A student who leaves is marked *Left*. The record is not deleted; it stops appearing in active lists and remains fully searchable by ID.

5. Online fee collection

Two rails, both wired in, because they fail in opposite directions and the school should not have to pick one and live with its weakness.

	SBI Collect	Razorpay
Where the money lands	Straight into the school's SBI account	Settles to the same account in about two working days
Cost on UPI / RuPay debit	Nil	Nil
Cost on cards and net banking	Nil to the school	~2% + GST
Confirmation in this system	Weekly import	Instant
Receipt to the parent	After the import runs	Automatic, within seconds

5.1 Why both

SBI Collect is the school's own bank, costs the school nothing on any mode, and puts money in the account with nobody in between. Its weakness is that it cannot tell this system anything — see 5.2.

Razorpay confirms the payment the moment it happens and emails the receipt without anyone touching it. Its weakness is a fee on cards and net banking, and a two-day settlement.

In practice most preschool parents pay by UPI, where **both are free** — the merchant discount rate on UPI and RuPay debit is set to zero by law (Finance Act 2020), for every provider in India, not as a concession by either company. So for the common case Razorpay costs the school nothing and simply works better. The ~2% applies only to the minority who reach for a credit card, and net banking carries a similar charge — it is not card-only.

Exact published rates change; **confirm both at the time of setup** — SBI at the branch, Razorpay on their pricing page. They are not quoted here as fixed numbers.

Recommendation: make Razorpay the default button in the parent portal, and keep SBI Collect as the alternative for parents who prefer paying through the bank directly. The school can turn either off without a code change.

5.2 The SBI Collect limitation, and how it is handled

SBI Collect is a hosted payment page, not a programming interface. It cannot notify this system that a parent has paid. So reconciliation is built instead, and this is where the registration ID earns its keep:

1. The school's SBI Collect form is configured with **Registration ID as a mandatory field** (plus student name, class, fee head, month or term). SBI allows the institution to define these fields when the Collect page is created.
2. A parent pays and gets an SBI reference number.

3. Once a week — or daily during fee season — the office downloads the transaction report from the SBI Collect merchant login.
4. That file is uploaded here. Every row is matched to a student by registration ID and to an open invoice by amount and fee head, then posted to the ledger with the SBI reference number stored against it.
5. Anything that does not match cleanly — wrong ID, part payment, a duplicate — lands in an exceptions list for a person to decide. Nothing is guessed and nothing posts silently.

Roughly ten minutes of office work a week at 30 students.

5.3 What the parent sees

A payment made through **Razorpay** shows as paid immediately, with the receipt in the portal and in the parent's inbox.

A payment made through **SBI Collect** shows as *awaiting confirmation* until the next import runs, which can be up to a week. The portal says so explicitly rather than continuing to show the fee as simply due — a parent who has just paid and sees an unchanged balance will telephone the office, and that call is the thing worth designing out.

This gap is the honest cost of the free rail, and it is the reason Razorpay is worth having alongside it rather than instead of it.

6. Running costs — AWS and Cloudflare

Borne by the school, billed directly to the school's own accounts. Nothing routes through DVLN Solutions LLP. Converted at ₹88 = \$1.

6.1 Recommended at 30 students

Service	What it is	\$/month	₹/month
AWS Lightsail — 2 GB, 2 vCPU, 60 GB SSD	Runs the application and database	12.00	1,056
Lightsail automatic snapshots	Daily backup, 7-day retention	3.00	264
Amazon S3 — 10 GB	Student photos and documents	0.30	26
Amazon SES	Receipts and notices by email, ~2,000/month	0.20	18
Cloudflare Free	DNS, CDN, SSL, firewall, bot protection	0.00	0
	Total	15.50	≈ ₹1,364

≈ ₹16,400 per year. Plus the domain, roughly ₹1,200 per year.

Cloudflare's free plan is not a trial — DNS, unlimited CDN bandwidth, the SSL certificate, the managed firewall rules and bot protection are all free permanently. At this size the school pays Cloudflare nothing.

6.2 If the school grows or wants more headroom

Service	\$/month	₹/month	
AWS Lightsail — 4 GB, 2 vCPU	24.00	2,112	
Lightsail managed PostgreSQL — 1 GB, with standby	15.00	1,320	
Snapshots	4.00	352	
Amazon S3 — 25 GB	0.60	53	
Amazon SES	0.20	18	
Cloudflare Pro — image optimisation, custom firewall rules, analytics	20.00	1,760	
	Total	63.80	≈ ₹5,615

Not needed now. Listed so the ceiling is visible before it is hit. Moving from 6.1 to 6.2 is a plan change in the AWS console, not a rebuild.

6.3 Charges that depend on usage

Item	Charge	At 30 students
SBI Collect	Nil to the school, any mode	₹0
Razorpay — UPI and RuPay debit	Nil	₹0
Razorpay — cards and net banking	~2% + GST	Only on fees actually paid that way
SMS, if enabled later	~₹0.20 per message	Optional; email is the default and near-free

Cash, direct UPI and SBI Collect cost the school nothing at all. Razorpay adds a charge only on the share of fees paid by card or net banking — if every parent pays by UPI, the monthly bill is unchanged.

6.4 One line on the current setup

The system runs today on Google Firebase, inside its free tier, at ₹0/month. The AWS and Cloudflare figures above are what it costs to move onto infrastructure the school controls outright — a real bill replacing a free one, buying control and portability rather than features. The 12 hours in workstream 6 cover that setup. The school can also stay on Firebase and spend nothing; the software is the same either way.

7. Timeline

Workstreams 1–7 are already delivered. The remaining 66 hours:

Weeks	Work
1	Teacher / staff CRM, staff attendance with location, fee payment — SBI Collect import and Razorpay
2	Parent portal completion, move to AWS and Cloudflare, cutover
3	Data import, training, handover

Two to three calendar weeks, full-time. Handover inside three weeks of signing.

8. Not included

Stated plainly so there is no argument later:

- Report cards, marks, exams, academic records
- Timetable generation
- Library and transport modules
- WhatsApp messaging (Meta charges per conversation)
- A mobile app — the system is a website that works on a phone, including staff check-in
- Biometric or RFID attendance hardware — staff attendance uses the phone they already carry
- Content writing and photography for the website

Any of these can be quoted separately at the same ₹500/hour.

9. Assumptions

1. The school provides content — text, photos, fee structure, class list — within the first week.
2. AWS, Cloudflare and domain accounts are opened in the school's name. The school owns every account and every rupee of infrastructure spend.

3. The school opens SBI Collect through its own SBI branch and configures the payment form with Registration ID as a mandatory field. Office staff are given the Collect merchant login so transaction reports can be downloaded.
4. The school opens a Razorpay merchant account in its own name and completes KYC. Settlement is to the school's SBI account.
5. Staff are told in writing, before the feature is switched on, that marking their own attendance records a location at that moment. This is a condition of building it, not a suggestion: it is their personal data, and the school is the one collecting it.
6. One person at the school is the point of contact for decisions and approvals.
7. Existing student data arrives as a spreadsheet in any consistent format.
8. Scope is what is listed in Section 3. Additions are quoted before they are built.

10. After handover

Option	Fee	Covers
Warranty	Free, 60 days	Anything that does not work as specified
Support retainer	₹1,500/month	8 hours of changes, security updates, backup checks, response within one working day
Ad-hoc work	₹500/hour	Billed on actual hours, no minimum, no retainer required

On final payment the source code and all data belong to Al Fitrah Pre School, Sarjapura. Every third-party account is already in the school's name, so nothing depends on the developer to keep running.
